                                                    ng the levels of expression of genes B1001, B1466, B1072 or B1151 rells; and comparing them with the level of expression in healthy T-The method is useful for diagnosing allergies, particularly atopic itis. The present sequence represents a PCR primer used for its of the expression of the above genes

The present invention describes a human genome-derived myosin-like CC protein 1 (hiDMLP-1). The protein and polynucleotide sequences of hdDMLP-CC 1 can be used in gene therapy and vaccine production. The hdDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify CC hdDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hdDMLP-1 corotein variants having desired phenotypic improvements, and for cexpressing the proteins. The hdDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hdDMLP cused as immunogens to raise antibodies that specifically recognise hdDMLP cand/or amount specifically of hdDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hdDMLP-1 production, and in vaccines or for replacement therapy. The conduction, and in vaccines or for replacement therapy. The disorder associated with the expression of hdDMLP-1, in particular heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; hear muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-JAN-2001;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               27-SEP-2000;

cc protein variants having desired phenotypic improvements, and for cxxpressing the proteins. The hGDMLP-1 proteins or polypeptides may be cc used as immunogens to raise antibodies that specifically recognise hGDMLP cc -1 proteins, as standards in assays used to determine the concentration cc and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as ctherapeutic supplement in patients having specific biomolecule cc production, and in vaccines or for replacement therapy. The cc polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a cc disorder associated with the expression of hGDMLP-1, in particular heart can skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. Cc The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. Cc The sequence data for this patent did not form part of the printed cc specification, but was obtained in electronic format directly from WIPO cc at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 2799

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cc nucleic acids can be used as probes to detect, characterise and quantify cc hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 cc protein variants having desired phenotypic improvements, and for c expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 cused as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 groduction, and in vaccines or for replacement therapy. The colymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a colymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a colymucleotide sequence encoding hGDMLP-1, in particular heart col and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the present sequence in the exemplification of the present invention. N.B. of the present invention. N.B. of the present invention of the printed capture of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

(i.e. differential display). Also included are methods of screening for candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence in the examination of allergic diseases, the use of reporter constructs in the screening of candidate compounds, a vector containing a the transcription controlling region of the gene, cells transformed with the vector, an antibody against the protein and a model animal for allergic diseases which is a transgenic non-human vertebrate with lowering of expression intensity of the gene in eosinophils. The method is examining allergic diseases particularly atopic dermatitis which is also applicable in screening candidate compounds for remedies. Such method can be performed in high throughput, at low cost. The present sequence is a differential display PCR primer for the cDNA encoding the human acetyltransferase-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        different expression particularly increased expression in remission stage, in eosinophils of patients, also applicable in screening candidate compounds for remedies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human cDNA appearing as ABK49633 which has homology with acetyltransferases in the eosinophils of a patient and comparing the expression level with that in the eosinophils of a healthy individual

The present sequence represents a PCR primer, in the course of the invention % \left\{ 1\right\} =\left\{ 1\right\} =\left
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used allergosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for examining allergic disease, which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99812-ABN99818 in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the
                                                                                                                            Human; allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sugita Y,
Takahashi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for examining allergic diseases with intersectin 2 gene or a gene with equivalent function of intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the eosinophils in a patient, and comparing the expression level with that in the eosinophils of a healthy individual. The method is for examining allergic diseases, particularly atopic dermatitie, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method for examining allergic diseases by differential display intersectin 2 gene showing different expression particularly si increase in eosinophils in patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Allergic disease; atopic dermatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for examining allergic diseases with intersectin 2 gene or a gene with equivalent function of intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the eosinophils in a patient, and comparing the expression level with that in the eosinophils of a healthy individual. The method is for examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sugita Y,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 2811
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chance, are useful for treatment of a patient having a condition cassociated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to cates the condition and cell. This sequence represents an acetylcysteine conditions of the coll to a cell of the discased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC regulate expression of chloride channel calcium activated 1. (CLCA1) genes constitutive genes are constitutive pulmonary disease (CDD), chronic bronchitis, asthma, cystic cobstructive pulmonary disease (CDD), chronic bronchitis, asthma, cystic cobstructive pulmonary disease (CDD), chronic bronchitis, asthma, cystic constitutive, set and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or cissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition consecuted with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions guitable for the catment, for example, oxygen therapy, bronchodilators, corticosteroids, concleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an conzymatic nucleic acid molecule of the invention

These sequences are used in a novel method for examining allergic diseases comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be needed to the time the compounds of the time the compounds of the time the compounds.
            This invention relates to gene sequences that are differentially expressed in cosinophils from patients with atopic dermatitis in the expressed in ecsinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission erage. These sequences are used in a novel method for examining allergic diseases comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or dermatological activities. The method can be used to disgnose allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTISC PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17 BP; 0 A; 1 C; 1 G; 15 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                            This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTISa PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences of the invention
                                                                                                                                                                                                                                                                Claim 1; Page
                                                                                                                                                                                                                                                                                      New nucleic acid sequences associated with tumor suppression, regres apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human tumour suppressor sequence #1412.
                                                                                                                                             Sequence

The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABX79793;

                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cc alignment, at least 80 % identity to the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence, a sequence that cc hybridizes to them under highly stringent conditions, or the complement cc fany of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for cromponent of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for cromponent of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for cromponent of a gene chip, in vitro as (anti)sense reagents, and for component of a gene useful for component of pharmaceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell containing the action and pharmaceuticals for prevention and/or treatment of viral cd degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in cation sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips.
                                                                                                                                                                                        RESULT 2817
                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                              proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 1p21.3-22., MDZ7 is encoded at chromosome 1p21.3-22., MDZ7 is encoded at chromosome 1p21.3-2 and MDZ12 is encoded at chromosome 1p21.2 and MDZ12 is encoded at chromosome 1p21.2 and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ1, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 gross are alterations in MDZ3, MDZ4, MDZ7, or MDZ12 acids can also be used as probes to detect and characterize gross are alterations in MDZ3, MDZ4, MDZ7, or MDZ12 gross are more detect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21:3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-JUL-2002; 2002EP-00016874

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stage of a plant can be controlled specifically. The current represents a PCR primer for amplifying a plant blastogenesis gene of the invention.
                                             This invention relates to a novel method for screening and examining allergic diseases by the use of B1799 as the indicator gene. Specifically, it comprises determining the expression level of this indicator gene in a biological sample obtained from the patient, and identifying differential expression (increased expression of B1799) in comparison to that observed in a healthy individual. The present invention describes the B1799 protein as antiallergic, antiinflammatory and dermatological. As such, through the use of gene therapy, this method can be used to treat allergic diseases particularly atopic dermatitis. Furthermore, it is useful for determining a diagnosis that is convenient and non-invasive, and is also applicable in high throughput screening to identify candidate compounds for additional remedies. This

The inventions can be used as diagnostic reagents fe.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can for treatment of apoptosis-related diseases

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in

Novel apoptosis-related DNAs and proteins - treating diseases associated with apoptosis.

                                                                                                                                                               This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hypertipemia, hypertension, arteriosclerosis, hyperticemia and sleep apnea syndrome. The genes (AAZ30631-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ30640-51

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to identification of genes and proteins of adipose tissue relating to obseity, particularly complications of visceral obseity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperruricemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAX67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-FEB-2000.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to functionalised nanocrystals for use in nonisotopic detection systems for biomolecules e.g. nucleic acids, proteins, lipids or drugs. The nanocrystals have polynucleotide strands attached to their surfaces with one end of the polynucleotide extending outwardly from the nanocrystal. The present sequence is one such polynucleotide. These nanocrystals are used with a second series of nanocrystals, which have polynucleotides complementary to the first polynucleotides, so that the respective complementary strands hybridise to each other and form a dendrimer. This dendrimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Adenine bases. This sequence may therefore be used with a polynucleotide composed mainly of Thymine bases (AAAS8386)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Functionalized nanocrystal carrying polynucleotide, target analyte, forms dendrimers with complementary amplify the fluorescent signal.
                                                                                                                      Functionalized nanocrystal carrying

The present invention relates to functionalised nanocrystals for nonisotopic detection systems for biomolecules e.g. nucleic acid proteins, lipids or drugs. The nanocrystals have polynucleotide attached to their surfaces with one end of the polynucleotide exoutwardly from the nanocrystal. The present sequence is one such

        The present invention describes an antisense compound (I) of up to 30 nucleobases in length capable of inhibiting the expression of human Smad7. (I) has antiinflammatory and cytostatic, and is a modulator of Smad7 expression. (I) can be useful for inhibiting the expression of human Smad7 in human cells or tissues, in vitro. (I) is commonly used a research research and in diagnostics for example, to elucidate the function of particular genes. (I) is also useful for distinguishing between functions of various members of a biological pathway and for research use. (I) is also useful for diagnostics, therapeutics, prophylaxis and in kits. (I) is also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. AAF26667 AAF26706 represent human Smad7 antisense oligonucleotides from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polynucleotide. These nanocrystals are used with a second series of nanocrystals, which have polynucleotides complementary to the first polynucleotides, so that the respective complementary strands hybridise to each other and form a dendrimer. This dendrimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Thymine bases. This sequence may therefore be used with a polynucleotide composed mainly of Adenine bases (AAA58385)
                                                                                                                                                                                                                           Antisense compound cap

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
The invention relates to a yeast cell comprising nucleotide sequences cc encoding first and second heterologous fusion proteins comprising first cand second peptides (P1, P2) of a peptide binding pair joined to a ctranscriptional activation protein (TAP) DNA binding domain or TAP cc transcriptional activation domain, respectively, and a luciferase gene cc activated by positive transcriptional control of TAP reconstituted by cobinding of P1 and P2. The cell is useful for detecting the interaction of a first peptide and a second peptide of a peptide binding pair which cc involves culturing the cell, incubating a test sample with the yeast cell cunder conditions suitable to detect the selected phenotype and detecting the level of expression of the luciferase gene. The cell is also useful cc for determining whether a test sample interacts with a first or second peptide of a peptide binding pair. The yeast cell comprises a nucleotide concernment of the peptide strategiant mimics and receptor mimics. The cell may be used for monitoring the binding of peptides by peptide binding pair compounds interactions, e.g., hormone/receptor conteractions. The cells are useful in the detection of the ability of the test sample to affect the binding of a peptide binding pair and contend through cells are also useful in the detection of the ability contends interaction. The screening methods can be used confidentifying compounds interacting with any peptide binding pair and contends interaction of that interaction, e.g., protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     kinases implicated in cancers can be inserted into the yeast system to screen for compounds that block the kinase-target interaction and thus may serve as unique cancer therapeutics; viral coat proteins such as human immunodeficiency virus glycoprotein and corresponding cell surface proteins such as CD4 can be inserted into the cell system to screen for compounds that disrupt this interaction and may serve as antiviral agents. The present sequence is a PCR primer used to isolate a cDNA encoding human G-alphaZ. G-alphaZ is expressed in yeast cells in a construct which uses the luciferase gene as a marker for the interaction between G-alphaZ and a coexpressed RGS-Z
                                                                                                                             The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinas other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                                                                          New hairpin and hammerhead ribozyme RNA encoding a cyclin or cell-cycle PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                         Tritz
                                                                                                                                                                                                                                                                                                                                                                                                                    06-DEC-1999;

                                                                                                                        nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn are account of the contractive used in the

After PCI amplification of nucleic acid samples using specific primer pairs, these probes can be used to detect Gi(alpha)1 mutations associated with oncogenesis. See AAQ13431-Q13542. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overall base sequence of lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially available universal primers or with fewer primers than required in existing methods. AAT73291-92 are primers used in determination of the DUC19 sequence. Primer extension was carried out using 16 primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Efficient sequencing of long DNA by fragment walking - with simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18-SEP-1995;

restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overall base sequence of lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially available universal primers or with fewer primers than required in existing methods. AAT73291-92 are primers used in determination of the pUC19 sequence. Primer extension was carried out using 16 primers
                                                                                                                                                                                                                                                                                                                                                                    Efficient sequencing of long DNA by fragment walking - with simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers.
                                                                                                                                                                                                                                   using a DNA polymerase, DNA sequencing. DNA fra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, applastic anaemia (panmyelophthisis), hepatitis, AlDS and organ graft
                                                                                                                                                                                                                          modified_base

CC against the gene encoding human microtubule-associated protein 4 (MAP4).

CI Inhibition of MAP4 expression was measured by determination of MAP4 mRNA

CC levels in a variety of cell lines via real-time quantitative PCR. The

CC cell lines used included the bladder carcinoma cell line T-24, the human

CC lung carcinoma cell line A549, human neonatal dermal fibroblasts and

CC croup of proteins that mediate microtubule-associated proteins comprise a

CC group of proteins that mediate microtubule assembly and function which is

CC required for cytoskeletal integrity. MAP4 is a member of the non-neuronal

CC structural MAP family and is believed to affect microtubule dynamics by

CC stabilising the microtubule lattice. MAP4 expression has been shown to be

CC linked to cancer chemotherapeutic drug sensitivity. These antisense

CC nolecules are useful for treating animals, particularly humans, having or

CC being prone to a disease or condition associated with the expression of

CMAP4. The oligonucleotides are also useful for research and diagnostic

CC applications

RESULT 2841
ABL48723
  CC molecule (I) that, induces apoptosis in cells with an abnormal Fas' Fas' CC ligand system, by binding to Fas on the cell surface, and prevents CC apoptosis in cells with a normal system, by inhibiting binding between CC Fas and its ligand. The products of the invention have anti-inflammatory, CC anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, CC immunomodulatory, dermatological, immunosuppressive, thyromimetic, CC antiarteriosclerotic, cardiant and hepatropic activity. (I) induce constrainteriosclerotic, cardiant and hepatropic activity. (I) induce conspicuous by binding to cell surface Fas or inhibit it by competitive continhibition of ligand binding. (I) are used to treat and/or prevent CC diseases associated with the Fas/Fas ligand system, especially systemic conseases associated with the Fas/Fas ligand system, especially systemic consease, Sjorgen's syndrome, pernicious or hypoplastic consenses, autoimmune hemolytic anemia, sterility, myasthenia gravis, condition, allergy, arteriosclerossis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulninant, chronic, viral cells of the pative ligand, do not induce liver disease, and have actively mimic cells. They bind to both human and murine Fas, so can be evaluated in cells. They wind to both human and murine Fas, so can be evaluated in the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents confirmer used in the construction of a humanised anti-Fas antibody HFE7A converted in the construction of a humanised anti-Fas antibody HFE7A converted in the method described in the construction of a humanised anti-Fas antibody HFE7A converted in the method described in the construction of a humanised anti-Fas antibody HFE7A converted in the method described in the construction of a humanised anti-Fas antibody HFE7A converted in the method described in the construction of a humanised anti-Fas antibody HFE7A converted to the construction of a humanise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the construction of anti-Fas antibodies of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drug for preventing or treating e.g. autoimmune disease or allergy, comprises humanized anti-Fas antibody.

                       The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing appytosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNFR2). Also described is a method for inhibiting expression of human or mouse TNFR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a human TNFR2 antisense chimeric phosphorothicate oligonucleotide, which is given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Humanised anti-Fas antibody related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compounds antisense to nucleic acid encoding human necrosis factor receptor 2 are useful to treat disease mouse tumor necrosis factor receptor 2 expression.

         The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC preventing a respiratory, lung or malignant disease or condition, also CC entiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory steroid in a subject, for reducing or depleting levels of contiinflammatory producing bronchodilation, increasing levels of adenosine ceceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or condition, inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20

CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC of, or reducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels CC of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at figure or a feeling in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SS X

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; antirheumatic; antiarthritic; gymecological; antiarteriosclerotic; Transforming Growth Factor beta-3; TGF beta-3; hyperproliferative disorder; cancers; atherosclerosis; rheumatoid arthritis; preeclampsia; fibrosis; phosphorothioate; ss.
                                    The present invention relates to antisense oligonucleotides (ADA66459-ADA66609), which inhibit Transforming Growth Factor (TGF) beta-3 expression. The oligonucleotides are useful for inhibiting the expression of TGF-beta3 in cells or tissues, and for treating an animal having a disease condition associated with TGF-beta3, e.g. a hyperproliferative disorder such as cancers of lung, liver, colon, osesphagus, pancreas, breast, skin or haematopoietic, atherosclerosis, rheumatoid arthritis,
                                                                                                                                                                 Novel antisense compound which is targeted to nucleic acid encoding transforming growth factor beta-3, and inhibits expression of TGF-beta 3, useful for treating a condition associated with TGF-beta 3, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

The method ensures determination of four types of herpes viruses in a single sample simultaneously. The method is useful in medicine, especially in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABZ59521;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 two internal primers I and III (ABZ80969) on the second stage. The methe ensures determination of four types of herpes viruses in a single sample simultaneously. The method is useful in medicine, especially in immunobiology, virology and molecular biochemistry. This sequence represents an alternative version of primer III with an inosine residue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of diagnosing herpes virus infections by two-stage polymerase chain reaction (PCR) carried out using two external primers I (ABZ80967) and II (ABZ80968) on the first stage and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a compound (I) that is 8-50 nucleobases CC in length targeted to a nucleic acid molecule encoding a 5'UTR, 3'UTR, CC coding region, intron region, exon region, stop codon, intron:exon CC punction, exon:exon junction, or 5' mRNA variant of src-c, and which CC specifically hybridises with and inhibits the expression of src-c. (I) CC have cytostatic, antiinflammatory, osteopathic and antibacterial CC activities, and can be used in antisense therapy and in vaccines. The CC entisense compounds (I) can be used for modulating the expression of src-c. c and for treating diseases or conditions associated with expression of CC src-c, e.g. aberrant bone remodeling or hyperproliferative disorders, CC garticularly cancer, such as breast cancer, neuroblastoma, retinoblastom CC cancer, overian cancer, oseophageal cancer, neuroblastoma, retinoblastom CC or Kaposi's sarcoma. (I) are also useful for diagnostics, therapeutics, CC prophylaxis, e.g. to prevent or delay infection, inflammation or tumour CC formation, as research reagents and kits, and in distinguishing between CC entertions of various members of a biological pathway. The present collegence represents a mouse src-c antisense chimeric phosphorothicate
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
